Title: CHICKEN RAISING

Author: Dahleness Gon  
-----

While handling chickens is a relatively easy task, as is collecting eggs, there are several pieces of information that will be of much use to the novice owner. For example, quite a number of hens have soft, delect fluff on their underside which they developed as chicks, but never outgrew. As a result, the coarse straw of the nest tends to irritate their hide. As a result, many hens will bury their eggs beneath a thin layer of straw. This provides warmth that the egg is missing because the mother will not fully set herself down upon the egg.

In addition, most hens do not lay their eggs at the same time as their sister hens. A hen must rest at the minimum three full hours before she will be capable of producing another. And do not be concerned if more time is necessary for thy hens to create more of their offspring.
